

The following listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Previously Presented) In a heat exchanger comprising at least one heat exchanger block, an insulating vessel which surrounds the heat exchanger block, pipes connected to said heat exchanger block for transporting fluids to and from said heat exchanger block, and securing means for securing the heat exchanger block hanging in the insulating vessel, the improvement wherein the heat exchanger block (1) is arranged movably in the insulating vessel whereby said means for securing permit thermally produced changes in the lengths of said pipes connected to said heat exchange block to be compensated for by movement of said heat exchanger block.
2. (Currently Amended) A heat exchanger according to Claim 1, wherein said heat exchanger block having a lower end and wherein [[,]] the lower end of the heat exchanger block (1) can move in at least two spatial directions.
3. (Previously Presented) A heat exchanger according to Claim 1, wherein the heat exchanger block (1) is suspended in such a manner that it can move freely above its center of gravity.
4. (Currently Amended) A heat exchanger according to Claim 1, wherein the heat exchanger comprises at least two[[,]] heat exchanger blocks (1).
5. (Previously Presented) A heat exchanger according to Claim 4, wherein the heat exchanger blocks (1) have feed and/or discharge lines which lead into a common connection line.
6. (Previously Presented) A heat exchanger according to Claim 1, wherein the

LINDE-581

securing means have joints (5, 7).

7. (Previously Presented) A heat exchanger according to Claim 6, wherein the securing means have two axes of rotation (6, 9) which lie perpendicular to one another.

8. (Previously Presented) A heat exchanger according to Claim 1, wherein the securing means have a first element (3), which is fixedly connected to the heat exchanger block (1), and a second element (4), which is articulately connected to the first element (3), the second element (4) being articulately secured in the insulating vessel.

9. (Currently Amended) In a low-temperature air fractionation plant comprising a principal heat exchanger and at least one fractionation column, the improvement wherein said the principal heat exchanger is a heat exchanger according to Claim 1.

10. (Previously Presented) A heat exchanger according to Claim 2, wherein the heat exchanger block (1) is suspended in such a manner that it can move freely above its center of gravity.

11. (Previously Presented) A heat exchanger according to Claim 4, comprising at least three heat exchanger blocks.

12. (Previously Presented) In a heat exchanger comprising at least one heat exchanger block, an insulating vessel which surrounds the heat exchanger block and securing means for securing the heat exchanger block hanging in the insulating vessel, the improvement wherein

the heat exchanger block (1) is arranged movably in the insulating vessel, the heat exchanger comprises at least two heat exchanger blocks (1), the heat exchanger blocks (1) have feed and/or discharge lines which lead into a common connection line, and the heat exchanger blocks (1) are suspended so that they can move freely above their centers of gravity,

LINDE-581

whereby said means for securing permit thermally produced changes in the lengths of said pipes connected to said heat exchange block to be compensated for by movement of said heat exchanger block.

13. (Previously Presented) A heat exchanger according to Claim 12, wherein each of said heat exchanger blocks have a lower end, and the lower end of each heat exchanger block (1) can move in at least two spatial directions.

14. (Previously Presented) In a heat exchanger comprising at least one heat exchanger block, an insulating vessel which surrounds the heat exchanger block and securing means for securing the heat exchanger block hanging in the insulating vessel, the improvement wherein

the heat exchanger block (1) is arranged movably in the insulating vessel, the heat exchanger comprises at least two heat exchanger blocks (1), the heat exchanger blocks (1) have feed and/or discharge lines which lead into a common connection line, the securing means have joints (5, 7), and the securing means have two axes of rotation (6, 9) which lie perpendicular to one another,

whereby said means for securing permit thermally produced changes in the lengths of said pipes connected to said heat exchange block to be compensated for by movement of said heat exchanger block.

15. (Previously Presented) A heat exchanger according to claim 1, wherein said heat exchanger comprises ten heat exchanger blocks arranged in two rows of five blocks each.

16. (Previously Presented) A heat exchanger according to claim 1, wherein said heat exchanger comprises eight heat exchanger blocks arranged in two rows of four blocks each.

17. (Previously Presented) A heat exchanger according to claim 8, wherein said first element comprises two plates secured to two opposites side of said heat exchanger block and said

LINDE-581

second element is a triangular plate.

18. (New) In a heat exchanger comprising at least one heat exchanger block having an upper end and a lower end, an insulating vessel which surrounds the heat exchanger block, pipes connected to said heat exchanger block for transporting fluids to and from said heat exchanger block, and means for securing connected to the upper end of said heat exchanger block whereby said heat exchanger block hangs in said insulating vessel, the improvement wherein the heat exchanger block (1) is arranged movably in the insulating vessel whereby said securing means permits the lower end of said heat exchange block to move in at least two spatial directions and said heat exchange block can move freely above its center of gravity.

19. (New) A heat exchanger comprising at least one heat exchanger block having an upper end and a lower end, an insulating vessel which surrounds said at least one heat exchanger block, pipes connected to the upper end and pipes connect to the lower end of said heat exchanger block for transporting fluids to and from said heat exchanger block, a first support plate attached to said heat exchange block at a first side of said upper end of said heat exchange block, a second support plate attached to said heat exchange block at a side opposite said first said of said upper end of said heat exchange block, and a third support plate attached to a support within said insulating box,

wherein said first and second support plates are pivotally attached to said third support plate whereby said lower end of said heat exchange block is free to pivot about an axis passing through the plane of said third support plate, and said third support is attached to said support by a joint which permits said third support and said heat exchange block to pivot about an axis perpendicular to the plane of said third support plate.

20. (New) A heat exchanger according to claim 19, wherein said third support plate is a triangular plate.

21. (New) A heat exchanger according to Claim 19, wherein said heat exchanger

comprises at least two, heat exchanger blocks.

22. (New) A heat exchanger according to Claim 21, comprising at least four heat exchanger blocks.

23. (New) In a low-temperature air fractionation plant comprising a principal heat exchanger and at least one fractionation column, the improvement wherein said principal heat exchanger is a heat exchanger according to Claim 19.

24. (New): A process for providing heat exchange between at least two fluids comprising introducing the at least two fluids into a heat exchanger wherein the fluids undergo indirect heat exchange,

said heat exchanger comprises at least one heat exchanger block, an insulating vessel which surrounds the heat exchanger block, pipes connected to said heat exchanger block for transporting fluids to and from said heat exchanger block, and securing means for securing the heat exchanger block hanging in the insulating vessel, and

wherein the heat exchanger block is arranged movably in said insulating vessel and wherein, during said indirect heat exchange between said at least two fluids, said means for securing permit thermally produced changes in the lengths of said pipes connected to said heat exchange block to be compensated for by movement of said heat exchanger block.
